Westminster Development Policy Network Virtual Seminars

Structural gravity: history

- Gravity model of trade (Tinbergen, 1962)
- Explosion of microfoundations of gravity (Eaton and Kortum, 2002; Anderson and van Wincoop, 2003; Chaney, 2008; Helpman et al., 2008)
- Unifying theory of structural gravity (Head and Mayer, 2014; Costinot and Rodriguez-Clare, 2015)

Structural model: theory

Structural gravity is represented by

$$X_{ij} = \frac{Y_i E_j}{Y} \left(\frac{\varphi_{ij}}{\Omega_i P_j}\right)^{(1-\sigma)} \tag{1}$$

- X_{ij} is export from country i to country j
- $Y_i = \sum_j X_{ij}$ is total value added of country *i*
- $E_j = \sum_i X_{ij}$ is total expenditure in country j
- σ is elasticity of substitution across varieties
- Y is global output.

Oleksandr Shepotylo Aston University Structural gravity modelling ◆□> ◆□> ◆三> ◆三> ・三> のへの

Multilateral resistance terms

 Ω and *P* are multilateral resistance terms (MRT). They capture all relevant global trade factors, that influence trade of countries i and j.

Outward MRT:

$$\Omega_{i}^{(1-\sigma)} = \sum_{j} \frac{E_{j}}{Y} \left(\frac{\varphi_{ij}}{P_{j}}\right)^{(1-\sigma)}$$
(2)

Inward MRT:

$$P_j^{(1-\sigma)} = \sum_i \frac{Y_i}{Y} \left(\frac{\varphi_{ij}}{\Omega_i}\right)^{(1-\sigma)}$$
(3)

Oleksandr Shepotylo Aston University Structural gravity modelling Westminster Development Policy Network Virtual Seminars

Trade costs

Our bilateral trade costs are given by

$$(1-\sigma) \times \ln \varphi_{ij} = \gamma_{dist} \ln(\lambda_{ij} \times dist_{ij}) + \gamma_{FTA} FTA_{ij} + Z_{ij}\gamma_Z + u_{ij}$$
(4)

- To estimate the potential effect of a regional free trade agreement we introduce a variable FTA=1 if free trade agreement and 0 otherwise
- ▶ Reduction in transportation cost, due to improved transport infrastructure is captured by λ_{ij} ≤ 1
- Z captures all additional information about bilateral trade: common language, common border, etc

Oleksandr Shepotylo Aston University Structural gravity modelling

Estimation of inward and outward MRT

- Estimation of inward and outward multilateral resistance terms is done by PPML (Silva and Tenreyro, 2006) with full set of exporting and importing countries fixed effects.
- This method got very popular in estimation of gravity models because
 - it performs better in dealing with no trade (so-called zeros in trade flows)
 - Fally (2015) demonstrated that if structural gravity (1) is estimated with full set of exporter and importer fixed effects, the estimated fixed effect coefficients represent a unique solution to the inward and outward multilateral resistance terms.

◆□> ◆□> ◆三> ◆三> ・三> のへの

Welfare impact of a counterfactual scenario relative to the baseline is computed according to

$$\hat{W} = 100\% \times \left(\frac{Y_i'}{P_i'} / \frac{Y_i}{P_i}\right)$$
(5)

Oleksandr Shepotylo Aston University Structural gravity modelling Westminster Development Policy Network Virtual Seminars

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ = 臣 = の久()

Algorithm of counterfactual analysis with structural gravity

- 1. Estimate the model by PPML, using actual data
- 2. Recover inward and outward multilateral resistance terms and compute welfare indices
- 3. Modify trade policy variables according to the scenario assumptions, keeping everything else constant
- 4. Estimate the model by PPML with new policy variables, keeping everything else constant
- 5. Recover counterfactual inward and outward multilateral resistance terms and compute new welfare indices and new trade flows
- 6. Compare the baseline and counterfactual variables

Belt and road

- Belt and road initiative includes a third of global trade and GDP and over 60 percent of world population
- It consists of Silk Road Economic Belt and Maritime Silk Road.
- 6 transport corridors: Eurasian Bridge, Mongolia-Russia, Central Asia-Turkey, Pakistan, Indochina, Myanmar.
- Maritime routs directed towards South East Asia, Gulf countries, North Africa and Europe.
- Overall, all roads lead to Europe.

2

The Projects

- Key issue: lack of credible information on the projects
- We use the database from the Reconnecting Asia Project at the Centre for Strategic and International Studies
- We estimate that 63 percent of the funding on BRI projects concerns (single mode) rail infrastructure
- The average cost for rail projects is the highest out of the three modes

◆□ > ◆□ > ◆臣 > ◆臣 > □ □ ● ○ ○ ○

Source: Centre for strategic and international studies

Oleksandr Shepotylo Aston University Structural gravity modelling Westminster Development Policy Network Virtual Seminars

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへで

The Projects

- The translation of these projects into transport cost reductions is central to the BRI
- Cost reductions may come from traders using the same routes or changing routes/modes
- There are a number of studies exploring the impact of transport infrastructure investment
- We model a range of transport cost reductions between 15-50 percent

50 percent transport cost reduction: realistic?

- Currently, maritime route from China to Central Europe takes about 30 days.
- Railways are half that time, but freight rates are much higher.
 (0.03 vs 0.3 USD per tonn per kilometer)
- Reed and Trubetskoy (2019) esimate that rail and road improvement reduce freight rate at 30-50 percent
- It also involves crossing several borders along the way contributing further to time and cost of land shipments.
- Improving railway and road infrastructure, streamlining customs procedures may dramatically change time and cost of trade between China and Europe, essentially making New Silk Road a dominant mode of transportation between those two large economic regions.

э

Key Findings

- Both China and EU countries gain under scenarios 1-3
- Signing and implementing an FTA between China and the EU is equivalent to transport cost reductions of approximately 45 percent
- Joint reduction of transportation costs (via the BRI) and signing an FTA generates welfare gains that exceed the sum of the welfare gains from the separate implementation of these policies

Oleksandr Shepotylo Aston University Structural gravity modelling

Key Findings

- The major gains of the China and EU FTA do not stem from tariff reductions
- Major gains come from other effects of an FTA, including lowering non-tariff measures, agreements in the services sectors and reduction of trade policy uncertainty
- If transport cost reductions exceeds 30 percent, the positive effect of the BRI on China would compensate for the potential negative effects of TPP

Oleksandr Shepotylo Aston University Structural gravity modelling

Westminster Development Policy Network Virtual Seminars

Motivation and Contribution

Two particularly dominant Chinese strategic narratives that have emerged under President Xi Jinping:

- Belt and Road Initiative (BRI)
- New Type of Great Power Relations

These policies are part of a shift towards an outward focused Chinese state

Oleksandr Shepotylo Aston University Structural gravity modelling Westminster Development Policy Network Virtual Seminars

Motivation and Contribution

- Research exploring the impact of politics on trade is fairly recent and growing rapidly
- The focus in much of this literature is on the impact of worsening political relations
- In a Chinese context, the modelling literature tends to focus on the negative consequences of diverging political views; e.g. 'Dalai Lama effect'
- We contribute to this body of literature by exploring the impact of positive political changes that may be generated as a result of Chinese involvement in BRI countries

Oleksandr Shepotylo Aston University Structural gravity modelling

We examine two questions:

- How do potential changes in the political environment, derived from the BRI, impact on trade and welfare?
- How do the trade and welfare impacts of reductions in trade costs compare to impact of changes in the political environment?

Identifying the key model parameters

 Production function estimation to estimate effect of political stability on productivity

$$Q_i = A_i K_i^{\alpha_K} L_i^{\alpha_L} \epsilon_i \tag{6}$$

$$\ln A_i = a_0 + a_1 h c_i + a_2 p s_i + u_i$$
 (7)

 Gravity model to estimate effect of military alliance and political affinity on trade

$$X_{ij} = \exp(\gamma_{dist} \ln(dist_{ij}) + \gamma_{ma} ma_{ij} + \gamma_{pa} pa_{ij} + Z_{ij} \gamma_Z + \xi_i + \eta_j) + e_{ij}$$
(8)

 Matching techniques to estimate how trade agreements influence political affinity

$$pa_{ijt} = \gamma RTA_{ijt} + D_{it} + D_{jt} + D_{ij} + \eta_{ijt}$$
(9)

Results

| Some observations |
|--|
| |
| For a number of countries, the results for the political stability scenario are very small, or even zero, as they already have a stability rating equal, or exceeding, the European and Central Asian average |
| The performance of the countries under the umbrella of the Cooperation between China and Central and Eastern European Countries (CEEC) group is particularly strong across the BRI, DA and PA scenarios |
| The increase in exports for India, Vietnam, Philippines and Lao is among the most moderate out of the BRI countries |
| <ロ> <間> <別> <用> (|

Table: Average change in welfare, percent by regions

Our full general equilibrium results produce stronger effects, since there is positive feedback from lower trade costs to price changes as well as gains in incomes and expenditures across all countries

Oleksandr Shepotylo Aston University Structural gravity modelling

Further findings

Findings

Based on our full general equilibrium results:

- Military alliances between BRI countries and China are expected to have the most positive effect on welfare, with particularly positive effects on China and South Asia
- Improved political stability across BRI countries is expected to have the most beneficial impact on South Asia.

◆□ > ◆□ > ◆臣 > ◆臣 > 善臣 - のへで

Conclusions

- The EU can capitalize on this opportunity if they can develop stronger strategic oversight of investment flows
- China must avoid an escalation of the criticisms around their investments as well as working to timescales that allows for appropriate due diligence
- Our results also suggest that the rewards for both China and the EU can be even greater if they are also willing to commit to a FTA

Oleksandr Shepotylo Aston University Structural gravity modelling ◆□ > ◆□ > ◆臣 > ◆臣 > 善臣 - のへで

Conclusion

- It is important to look beyond economic gains derived from trade cost reductions
- Politically aligning countries participating in the BRI and providing security to the countries where China invest in transport and infrastructure has the potential to deliver significant benefits
